Maria-DB

MariaDB ist die neue Datenbank Version und ersetzt die MySQL Datenbank. Der Installationsprozess und die Behfehle für die Konfiguration und Servicearbeiten bleiben identisch.

Installation Prozess

Installing MariaDB on Ubuntu 14.04. Firstly, we need to install the software-properties-common package for MariaDB.

```
//Firstly, we need to install the software-properties-common package for
MariaDB.
sudo apt-get install software-properties-common

//Then we need to add the key to MariaDB's package repository.
sudo apt-key adv –recv-keys –keyserver
hkp://keyserver.ubuntu.com:800xcbcb082a1bb943db

//Afterward, we need to add MariaDB's package repository.
sudo add-apt-repository 'deb
http://mirror.jmu.edu/pub/mariadb/repo/5.5/ubuntutrusty main'

//We should update our local package repository.
sudo apt-get update

//Now we can download the package.
sudo apt-get install mariadb-server

//To create the MariaDB structure, we should stop the running MySQL and then
say "mysql_install_db". Let's restart.
sudo service mysql stop
sudo mysql_install_db
sudo service mysql start

//After the structure is created, we should say "mysql_secure_installation"
to create test tables and anonymous users.
//We should then do configurations according to the few questions in the
command output.

sudo mysql_secure_installation
```
