# Maria-DB

MariaDB ist die neue Datenbank Version und ersetzt die MySQL Datenbank. Der Installationsprozess und die Befehle für die Konfiguration und Servicearbeiten bleiben identisch.

## Installation Prozess

Installing MariaDB on Ubuntu 14.04. Firstly, we need to install the software-properties-common package for MariaDB.

```
1. //Firstly, we need to install the software-properties-common package  
for MariaDB.  
2. sudo apt-get install software-properties-common  
3.  
4. //Then we need to add the key to MariaDB's package repository.  
5. sudo apt-key adv --recv-keys --keyserver  
    hkp://keyserver.ubuntu.com:800xc0c082a1bb943db  
6.  
7. //Afterward, we need to add MariaDB's package repository.  
8. sudo add-apt-repository 'deb  
    http://mirror.jmu.edu/pub/mariadb/repo/5.5/ubuntu trusty main'  
9.  
10. //We should update our local package repository.  
11. sudo apt-get update  
12.  
13. //Now we can download the package.  
14. sudo apt-get install mariadb-server  
15.  
16. //To create the MariaDB structure, we should stop the running MySQL and  
then say "mysql_install_db". Let's restart.  
17. sudo service mysql stop  
18. sudo mysql_install_db  
19. sudo service mysql start  
20.  
21. //After the structure is created, we should say  
    "mysql_secure_installation" to create test tables and anonymous users.  
22. //We should then do configurations according to the few questions in  
the command output.  
23. sudo mysql_secure_installation
```
